Congratulations! You passed!

Grade received 100% Latest Submission Grade 100% To pass 80% or higher

You've built a new system for making loan approval decisions. For now, its output is not used in any decision making process, and a human loan officer is solely responsible for deciding what loans to approve. But the system's output is logged for analysis. What is this type of deployment called?

1/1 point

- Blue green deployment
- Canary deployment
- Shadow mode deployment
- Red green deployment

That's right! Shadow mode is a type of deployment where the ML algorithm runs in parallel with the user but it's output isn't used for any decision making.

1/1 point

- Monitor that 1% of users' reaction, and either gradually ramp up (if it's going well) or rollback (if not)
- After a successful canary deployment, begin to implement a shadow mode deployment.
- Monitor that 1% of users' reaction, and if it goes well, flip the switch to send all traffic (100%) to the system.
- Use a plan to ramp up to more users at a fixed rate: 1% in the first week, 2% in second week, 4% in third, and so on, so that the rollout can be well planned and managed.

That's right! A canary deployment allows you to monitor the performance of an algorithm on a subset of all traffic and then either ramp up to more traffic or rollback if an issue is detected.

3.	You're building a healthcare screening system, where you input a patient's symptoms, and for the easy cases (such as an obvious case of the common
	cold) the system will give a recommendation directly, and for the harder cases it will pass the case on to a team of in-house doctors who will form their
	own diagnosis independently. What degree of automation are you implementing in this example for patient care?
	O Full Automation
	O Human only

Partial Automation

Shadow mode

(Correct

That's correct! This type of approach offers some automation, but still requires a human in the loop.

1/1 point

4. You have built and deployed an anti-spam system that inputs an email and outputs either 0 or 1 based on whether the email is spam. Which of these will

None of these will result in either concept drift or data drift.

Updating a monitoring dashboard to keep track of new metrics.

Correct

That's right! Changing the wording will result in a concept or data drift.

1/1 point

Decause deployment is a high stakes event, it's critical to design the right system, so that immediately after launch it will immediately work reliably and scale effectively.

_

Correct

That's correct! Don't plan or expect to perfect the deployment on your first attempt, it's much more reasonable and efficient to iterate on the process and optimize its performance over time.
